Start GMT 01-August-2012, 214/08:00:00.001

Glenn Research Center

PIMS ISS Acceleration Handbook
Date last modified 2013-02-04

Description

Sensor	121f03 500 sa/sec (200 Hz)
Location	LAB101, ER2, Lower Z Panel
Plot Type	spectrogram (Σ); $f < 10$ Hz

Notes:

- Historically, the ISS has been maneuvered from one attitude to another using the most direct route via an Eigen axis maneuver. For the Optimized Propellant Maneuver (OPM), flight controllers perform a sequence of several small maneuvers, which takes the station on a less direct route to the new attitude. This indirect route leverages environmental forces on the station to assist the maneuver, resulting in a significant propellant savings.
- This spectrogram shows the impact of the OPM in preparation for Progress 48P docking from a sensor located in the USL. Note the broadband excitation below 6 Hz, mostly concentrated at vehicle structural modes.
- The gray arrows on the time-axis mark the start and stop of the OPM from GMT 01-Aug-2012/1:55-13:25.

Regime: Vibratory

Category: Vehicle

Source: OPM

Optimized Propellant Maneuver (OPM) from +XVV to -XVV Qualify

Glenn Research Center

PIMS ISS Acceleration Handbook
Date last modified 2013-02-04

Description

Sensor	121f05 142 sa/sec (6 Hz)
Location	JPM1F5, ER4, Drawer 2
Plot Type	spectrogram (Σ); $f < 1$ Hz

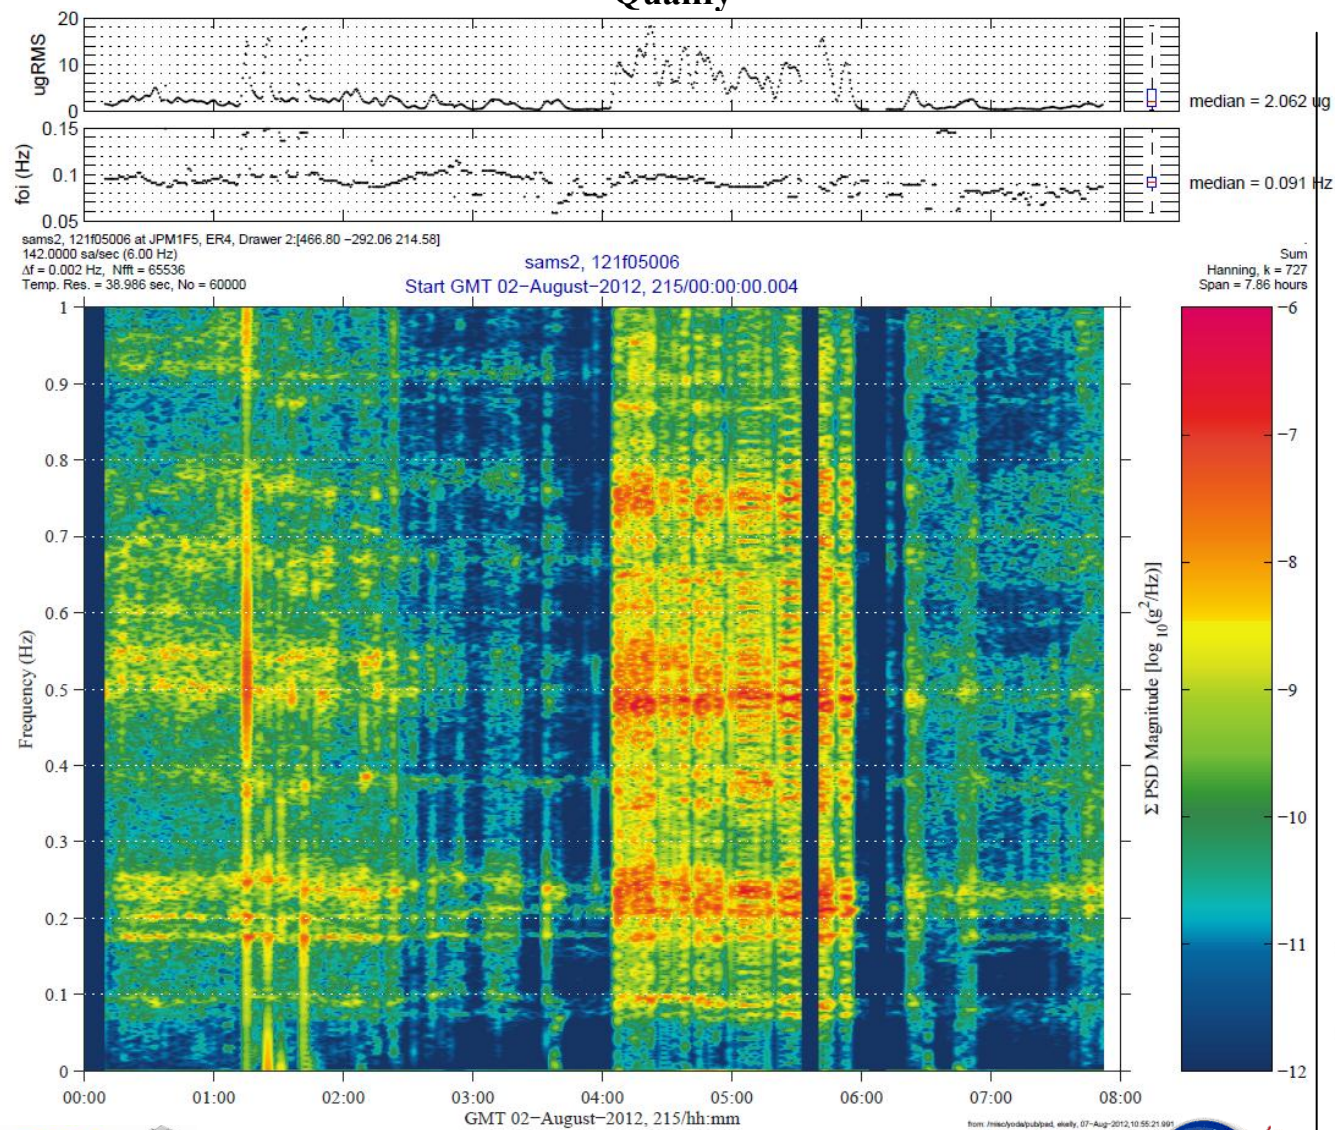

Notes:

- This spectrogram shows a zoom-in below 1 Hz for the same span and of the OPM event described on the previous page.
- Note the emergence of a lower mode during the OPM indicated by the horizontal, clear right-arrow and subsequent return to nominal “mode one” afterwards.
- This JEM sensor also registers higher levels of structural excitation compared to the USL.

Regime:	Vibratory
Category:	Vehicle
Source:	OPM

Optimized Propellant Maneuver (OPM) from -XVV to +XVV Qualify

Glenn Research Center

PIMS ISS Acceleration Handbook
Date last modified 2013-02-04

Description

Sensor	121f05 142 sa/sec (6 Hz)
Location	JPM1F5, ER4, Drawer 2
Plot Type	spectrogram (Σ); $f < 1$ Hz

Notes:

- According to the as-flown timeline, another OPM was performed to maneuver the station from -XVV to +XVV on GMT 02-Aug-2012 from 04:15-05:45. This spectrogram shows it actually started a bit early.
- Compared to the previous day's OPM, this one did not exhibit the distinctive shift down in frequency, but clearly shows twin peaks just at/below about 0.1 Hz ("mode one").

Regime:	Vibratory
Category:	Vehicle
Source:	Mode One

Optimized Propellant Maneuver (OPM)

Maneuver from +XVV to -XVV for Progress (48P) Docking

Start GMT 01-August-2012, 214/10:55:00.562

Description

Sensor	MAMS OSS 0.0625 sa/sec, (0.01 Hz)
Location	LAB102, ER1, Lockers 3,4
Plot Type	Per-axis ug vs. time

Notes:

The per-axis acceleration versus time plots shown to the left spans 3 hours starting at GMT 01-Aug-2012/10:55 and shows the quasi-steady impact of this OPM as follows:

1. The X-axis exhibits a low-level offset (about 0.7 μg) that gradually comes and goes over about a 45-minute span.
2. The Y-axis exhibits a distinctive, bipolar event with peak-to-peak magnitude of about 4 μg . This occurs during the same span as the X-axis' offset.
3. The Z-axis is mostly unaffected during the OPM.
